Multilanguage project

14/12/2017

Jonathan Cuotto

Project for Athmos

Introduction

System to manage the multilanguage translation for projects. The example for this user manual is Iva project.

Topics

1. Languages.
2. Modules.
3. Items
4. Translations

Setting language for the original project

At the beginning, there is no language. For this, there is not a current language for the project.

NAVIGATION

- Dashboard
- Languages**
 - + Add Language
- Modules

Language's list: none

HUB TRIBUTARIO

Current language: None

Click to add a language

Add Language

Search:

Show 10 entries

FLAG	ISO	NAME
No data available in table		

Creating a language

Iso

Example: en, es..

Name

Save

The iso, is the code of the language, like en = english. There is a folder in the project with all country flags. So, if you are creating the italian language, the iso would be "it", of italia, or "es" for spanish (España)

After creating at least one language, activate it clicking “activate” on the language’s table

Current language:

Languages

Show entries

[Add Language](#)

Search:

ACTIVE	FLAG	ISO	NAME			
		it	Italiano	Activate	Edit	Delete

Click here to activate a language

Current language: Italiano 

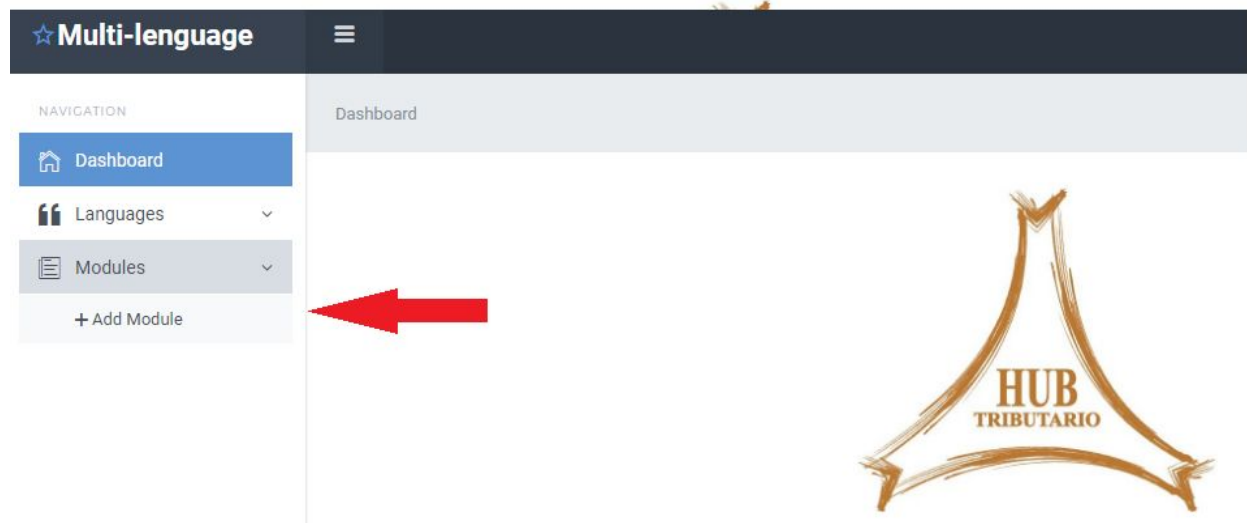

Actual language updated successfully. ×

Languages

Now the project, is running in Italian. But, we need the modules and the translations.

Modules

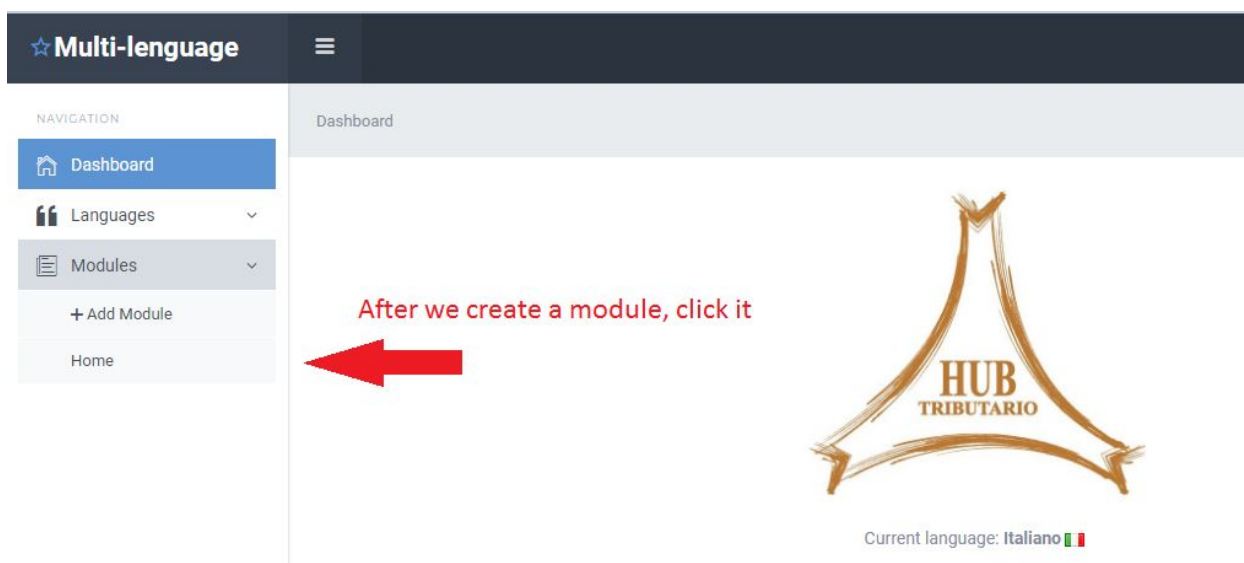

I. Create a module

Remember, a module could be anything by developer's criteria. Could be something in the pages that a site contains, or sections on a landing page.

A screenshot of the 'Create module' form in the same web application. The header is the same as the previous screenshot. The 'NAVIGATION' sidebar is also present. The main content area has a light grey header with the text 'Dashboard / Create module'. Below this, there's a form with a label 'Module name' and a text input field. At the bottom of the form, there's a blue button labeled 'Save'.

After we create a module, we could go to the module's page to manage it.

II. Manage the module

In the module page, there are the items which the developers use in the code, for print the text on the html. Also, there are the different languages.

Create Item

NAME	DESCRIPTION	
home_title	title for tell the user to select the type of company	Edit Delete

Showing 1 to 1 of 1 entries

Previous 1 Next

Translations

English Italiano

Click on the tabs to get the language's translations

III. Items

The items, are any key that the developer will use to print the text on the html. For each item, there should be a translation for every language.

For example:

On the iva project, the home page has a title "Seleziona La tipologia Di Azienda".

So this, would be a item, specifically "home_title", because is the home page title. For this, first, create the home_page item.

Module - Home

Items

Show 10 entries

Search:

NAME	DESCRIPTION		
home_title	title for tell the user to select the type of company	Edit	Delete

Showing 1 to 1 of 1 entries

No data available in table		

There is no translation made, so click on Add translation.

IV. Translations

Remember, there should be a translation in every language for every item. Create a translation for the home title in every language.

Dashboard / Home - Create Translation

Language 

Italiano

The language is only for read because, we clicked add translation on the italian tab

Item

home_title

Translations done!!!

Now that we have the translations, we can change the current language to see the changes on the project.

Change the current language while watching the original project.

NOTE: Obviously, the process of creating the modules and items is a production mode, made by the developer. Once the project are running in the client server. This project should only be used to manage the languages and translations.
